SUMMARY

Software engineer with 3.5 years building SaaS products used by businesses in the UK, Europe, and Asia. I work on both sides of the stack — Node.js and Express REST APIs on the server, React, Next.js, and TypeScript on the client — and I like the parts most people skip: designing the API contract before the code, keeping the codebase clean enough that the next feature is cheap, and staying on until a production issue is actually fixed. I run a Kubernetes cluster at home for the same reason, so Docker and container deployments are things I use, not things I have read about.

SKILLS

Backend: Node.js, Express.js, REST API design and integration, authentication, payment gateway and webhook integration, MongoDB

Frontend: React.js, React Native, Next.js, TypeScript, ES6 JavaScript, Redux, TanStack Query, HTML, CSS, Tailwind, Material-UI

DevOps: Docker, Kubernetes (self-hosted k3s cluster), Nginx/Traefik reverse proxy, TLS/DNS, CI and deployment workflows, Firebase

Practices: Clean code and Clean Architecture, monorepo tooling, multi-tenant SaaS design, code review, Agile/Scrum

Quality & Tooling: Git, GitHub, SonarQube, Sentry, E2E testing, performance and bundle optimization

EXPERIENCE

Indetechs Software Ltd. — product built for a UK client

Dec 2024 to Present

Software Engineer (promoted from Jr. Software Engineer), Dhaka, Bangladesh

A multi-tenant SaaS platform where each business customer gets their own branded workspace to create, manage, and publish product data.

Named Developer of the Year 2025.

- Take features from requirement to production: agree the API contract with the backend team, build both sides of it, test, release, and support it afterwards.
- Built an internal command-line tool that generates the code our apps use to call backend services. A day of hand-written, error-prone integration work became one command — the whole team uses it daily.
- Led the restructure of the codebase to Clean Architecture in a monorepo. Business logic no longer depends on the API layer, so swapping a data source stopped meaning a rewrite, and shared code stopped being copy-pasted between apps.
- Designed a configuration-driven customer-facing site so onboarding a new enterprise client with their own branding is a config change instead of a new build. It now serves live customers, including one rollout presented at a trade show in China.
- Shipped multi-language support across the whole product with AI-assisted translation, replacing a slow manual process.
- Traced and fixed a production outage in the application's startup layer late at night, so the team was unblocked before the next working day.
- Cut page load times and bundle size before customer demos, review teammates' pull requests, and onboard new engineers.

SEOPage1

Feb 2024 to Dec 2024

Frontend Developer (promoted from Junior within six months), Dhaka, Bangladesh

Core contributor to the company's in-house ERP platform, built on a PHP/Laravel backend and used daily by the whole company.

- Owned the platform's largest module — a sales risk assessment system — end to end, working with the backend team on the endpoints and payloads behind it.
- Cut a core page's load time from around 50 seconds to 15 by removing redundant API calls and dead code, and rebuilt a slow legacy page into a faster, more interactive one.
- Built an online examination system used to assess employees: scheduling, difficulty levels, automatic scoring, fullscreen lock, and screenshot-based proctoring.
- Delivered role-based dashboards, task checklist and review workflows, project tracking with goal setting, and an automated price quotation flow used by the sales team.
- Added error tracking and logging, set up a shared design system, and built a browser extension that checks how a page responds across screen sizes, which sped up QA.

Kylo Apps

Jul 2022 to Oct 2023

SDE-I (joined as an intern, moved to SDE-I in December), New Delhi, India

- Built full stack features with Node.js, Express, MongoDB, React, and Next.js — REST endpoints and data models as well as the interfaces on top of them — delivering 5+ projects and supporting 10+ more.
- Integrated payment gateways including Razorpay: server-side order creation, signature verification, and webhook handling.
- Set up team workflows and mentored interns. Projects included a B2B commodity trading platform, an e-commerce seller dashboard, a QR-code product, and a property installment tool.

PERSONAL INFRASTRUCTURE

- Self-hosted Kubernetes cluster** — github.com/mdmahfujarrahman/home-lab

I run a k3s cluster on a home server: applications packaged as Docker images, deployed from manifests, exposed through a Traefik reverse proxy with TLS and my own domain, and monitored with Prometheus and Grafana. The repository is public, including the debugging write-ups behind the trickier problems.

EDUCATION

NPI University of Bangladesh

Dec 2018 to Jun 2021

B.Sc. in Food Engineering, Dhaka, Bangladesh
